The ANT gene is expressed and functions not only in developing ovules but also it various developing organs. Growth and cell proliferation in plant can be modulated by modulating ANT activity. Modulation of ANT activity is used to alter organ mass, control fertility and enhance assexual reproduction in plants. Increased ANT activity can be used to produce male or female sterile pilants. Inhibition of ANT activity can be used to truncate vegetative growth, resulting in early flowering
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Modulating growth and cell proliferation in a plant used to alter organ mass, control fertility and enhance asexual reproduction in plants comprises modulating ANT activity and selecting plants with altered cell

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    US-10-024-632-2 (1-663) x ABX13437 (1-2148)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention describes a novel cassette for the transgenic expression of nucleic acid containing the promoter of the LOX5 gene from Arabidopsis CC thaliana or deletion variants of the LOX5 promoter which are functionally liked to the mucleic acid of the invention. The cassette is used to compare transgenic organisms, especially plants, for production of foods, animal feeds, seeds (including those with increased resistance to stress cc and disease, altered starch/lipid contents or dormancy, or altered fibre content), pharmacceuticals (especially antibodies, vaccines, enzymes and cc pharmaceutical proteins) and fine chemicals (especially enzymes and contents), pharmacceuticals (especially antibodies, vaccines, enzymes and contents), pharmacceuticals (especially antibodies, vaccines, enzymes and cc perfumes and dyes), also to produce sterile plants. The LOX5 promoter cc provides strong and specific expression in cotyledons and/or other early cm provide strong and specific expression in cotyledons and/or other early cc embryonic tissues are particularly sensitive. Since cotyledons are the cm storage organs of seeds, expressing transgenes in them produces crayledons is homogeneous, there are no side effects on other plant corgans (pollen) and the promoter is functional value. Expression in the corgans (pollen) and the promoter is functional value. Expression in the corgans (pollen) and the promoter is functional value variety of cc plants (ornamentals or crops). This sequence associated with the Arabidopsis thaliana LOX gene described in the disclosure of the invention

The ANT gene is expressed and functions not only in developing ovules but also in various developing organs. Growth and cell proliferation in plant can be modulated by modulating ANT activity. Modulation of ANT activity is used to alter organ mass, control fertility and enhance asexual reproduction in plants. Increased ANT activity can be used to produce male or female sterile plants. Inhibition of ANT activity can be used to truncate vegetative growth, resulting in early flowering.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Modulating growth and cell proliferation in a plant used to mass, control fertility and enhance asexual reproduction in comprises modulating ANT activity and selecting plants with

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes an isolated nucleotide fragment (I) comprising a nucleic acid sequence (NS) chosen from a NS encoding a CC comprising a nucleic acid sequence (NS) chosen from a NS encoding a CC comprising (PP) having receptor-like protein kinase activity, mitogen CC activated protein (MAP)-kinase activity, LTPIS-like transcription factor CC activity and CKC-like transcription factor activity. Also described: (1) CC complement (II) of (I); (2) a chimeric construct (III) comprising (I) or CC (II), operably linked to a regulatory sequence; (3) a plant (IV) and (5) CC comprising (III) in its genome; (4) seeds (V) obtained from (IV); and (5) CC conjobtained from (V). (I) or its part can be used in antisense CC inhibition or co-suppression in a transformed plant. (III) is useful for CC canola, Brassica, sorghum, sunflower or coconut. (III) is also useful for CC creating transgenic plants having altered lipid profiles. (I) can also be used as a hybridisation probe. ACC00626 to ACC00668 and ABR40591 to CC used as a hybridisation probe. ACC00626 to ACC00668 and ABR40591 to CC reserving the present sequences used in the exemplification of the present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  activity, caleosin-like activity, ATP citrate lyase activity, SNF1-like activity and CKC-like transcription factor activity. Also described: (1) accomplement (II) of: (I); (2) a chimeric construct (III) comprising (I) or (II), operably linked to a regulatory sequence; (3) a plant (IV) comprising (III) in its genome; (4) seeds (V) obtained from (V); and (5) oil obtained from (V). (I) or its part can be used in antisense inhibition or co-suppression in a transformed plant. (III) is useful for altering the oil phenotype in a plant such as corn, soybean, wheat, rice, canola, Brassica, sorghum, sunflower or coconut. (III) is also useful for creating transgenic plants having altered lipid profiles. (I) can also be used as a hybridisation probe. ACC00626 to ACC00868 and ABR40591 to ABR40879 represent sequences used in the exemplification of the present invent

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes an isolated nucleotide fragment (I) comprising a nucleic acid sequence (NS) chosen from a NS encoding a compressing a nucleic acid sequence (NS) chosen from a NS encoding a copyopetide (PP) having receptor-like protein kinase activity, mitogen activated protein (MAP)-kinase activity, LIP15-like transcription factor activity and CKC-like transcription factor activity. Also described: (1) cc activity and CKC-like transcription factor activity. Also described: (1) cc complement (II) of (I); (2) a chimeric construct (III) comprising (I) or comprising (III) in its genome; (4) seeds (y) obtained from (IV); and (5) cc comprising (III) in its genome; (4) seeds (y) obtained from (IV); and (5) coll obtained from (V). (I) or its part can be used in antisense conjunction or co-suppression in a transformed plant. (III) is useful for canola, Brassica, sorghum, sunflower or coconut. (III) is also useful for creating transgenic plants having altered lipid profiles. (I) can also be used as a hybridisation probe. ACC00626 to ACC00868 and ABR40591 to

Novel nucleotide fragment encoding polypeptides having receptor-like protein kinase activity, caleosin-like activity, useful for altering oil phenotypes in plants such as sunflower, coconut, soybean, wheat and rice.

Claim 18; Page 379-380; 542pp; English.

CC The present invention describes an isolated nucleotide fragment (I) comprising a nucleic acid sequence (NS) chosen from a NS encoding a CC polypeptide (PP) having receptor-like protein kinase activity, mitogen activated protein (AMP)-kinase activity, LIPIS-like transcription factor activity and CKC-like transcription factor activity. Also described: (I) cc complement (II) of (I); (2) a chimeric construct (III) comprising (I) or CC (II), operably linked to a regulatory sequence; (3) a plant (IV) and (5) cc comprising (III) in its genome; (4) seeds (V) betained from (IV); and (5) cc inhibition or co-suppression in a transformed plant. (III) is useful for canola, Brassica, sorghum, sunflower or coconut. (III) is also useful for creating transgenic plants having altered lipid profiles. (I) can also be used as a hybridisation probe. ACC00626 to ACC00868 and ABR40591 to canola, present sequences used in the exemplification of the present construction.

The gene was isolated CC following a rice database screening using soybean ANT-like polypeptide CC following a rice database screening using soybean ANT-like polypeptide CC rice clone (see ABN84482) encoding OsANTI (see ABN94684. An additional rice clone (see ABN84482) encoding OsANTI (see ABN9638) was also CC polypeptides comprising, in the N-terminal to C-terminal direction, 2 AP2 DNA binding domains followed by an amino acid subsequence selected from CC those given in ABN9629-35. ANT-like polypeptides were identified in CC soybean, rice, cotton and corn (see ABN96441). Nucleic acids (see CC ABN84480-86) encoding the ANT-like polypeptides can be used in the CC construction of transgenic plants, especially corn, soybean, canola, wheat, cotton, tomato or potato (all claimed) having improved agronomic, CC wheat, cotton, tomato or potato (all claimed) having improved agronomic, CC morticultural or other quality traits, such as increased size of plant CC cross These plants are especially useful for production of ethanol or CC animal feedstuff. The nucleic acids may also be used in antisense CC suppression to modulate expression of endogenous ANT-like gene expression, in sense co-contrology to supprise sendogenous ANT-like gene expression, in sense co-contrology to an amino acid smay also be used in antisense co-contrology to suppression of endogenous ANT-like genes, as grace for traits linked to those genes, or in the CC antistion in one or more endogenous genes encoding the ANT-like control of a suppression encoding the sendogenous genes encoding the ANT-like control of a control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Hе
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New nucleic acids encoding AINTEGUMENTA-like polypeptides useful in improving agronomic, horticultural, and quality traits of plants, such increased size of plant organs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Example 2; Page 147-151; 169pp; English.

                                                                                                                                                                                                                                   The present invention describes an isolated nucleotide fragment (I) comprising a nucleic acid sequence (NS) chosen from a NS encoding a CC comprising a nucleic acid sequence (NS) chosen from a NS encoding a CC polypeptide (PP) having receptor-like protein kinase activity, mitogen CC activity, caleosin-like activity, LTP15-like transcription factor cc contivity and CKC-like transcription factor activity. Also described: (1) CC complement (II) of (I); (2) a chimeric construct (III) comprising (I) or CC (II), operably linked to a regulatory sequence; (3) a plant (IV) and (5) CC comprising (III) in its genome; (4) seeds (V) obtained from (IV), and (5) CC contivity and from (V). (I) or its part can be used in antisense (CC contile the oil phenotype in a transformed plant. (III) is useful for CC canola, Brassica, sorghum, sunflower or coconut. (III) is also useful for CC creating transgenic plants having altered lipid profiles. (I) can also be used as a hybridisation probe. ACC00626 to ACC00668 and ARA40591 to invention

                                                        The invention relates to a number of isolated Arabidopsis thaliana cDNA sequences and their encoded proteins which are especially transcription factor related cDNA's and proteins. The isolated or recombinant plant transcription factor polynucleotides and polypeptides are useful in producing transgenic plants with commercially valuable properties, i.e. modified or altered desirable traits as compared to a reference plant such as an alteration in a plant growth characteristic, e.g. growth rate, germination rate of seeds, vigor of plants and seedlings, or leaf and flower senescence. Sequence information related to the polynucleotides and polypeptides can also be used in bioinformatic search methods. The transgenic plant is useful for growing a progeny plant from a parent plant. This sequence represents one of the cDNAs of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New plant transcription factor polynuclectides and polypeptides, useful in producing transgenic plants with commercially valuable properties, such as an alteration in a plant growth characteristic, e.g. growth rate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         11-DEC-2001; 2001US-0338692P.
